Due Date:	09 October 2026	**Module Code:**	HCGDP1181

What is the milestone for this week?

Apply feedback from the previous assignment submission and begin working towards an improved breeding system, with focus on unique child prefabs and models that correspond to a combination of specific parents.

Have you achieved this milestone? Mark it with an X

YES	☒	NO	

List what you have achieved this week.

- **Fixed the Double-Stat Bug:** Solved a critical bug where cloning a parent monster caused the baby to register two copies of the same stat (like having two Love stats), which broke the calculations. I fixed this by clearing the stat list on awake.
- **Added Type-Safe Enums:** Replaced risky text name lookups with a clean dropdown menu (enum) for Monster A, B, and C. This completely stops typos from breaking the code.
- **Implemented Live Mesh Fusion:** Programmed the system to read the parents' actual 3D shapes at runtime. The baby now copies either the mother's or father's exact mesh using a 50/50 genetic coin flip, removing the need for a rigid baby prefab.

If any, list any changes you have made to your initial proposal due to insufficient time or scope.

I removed the old plan where I would manually place a child prefab into a slot in the breeding room script. Instead, I switched to live mesh copying. This means the breeding system is much more dynamic, the colors are random, and the baby always keeps a physical trait from its parents (the mesh shape) without bloating the project file size.

What is the milestone for this week?

To check if there are any small additions to make my project feel even more professional and polished.

Have you achieved this milestone? Mark it with an X

YES	☒	NO	

List what you have achieved this week.

- **Polished the Codebase:** Checked over the grading rubric and cleaned up the scripts to make sure everything is neat, well-organized, and has no repeated code.
- **Verified NavMesh and Movement:** Tested the system to ensure that when a baby scales up or down based on its speed stat, its NavMesh Agent component updates smoothly.
- **Protected Vital Love Stats:** Made sure that vital metrics needed to keep the game loop going (like the Love stat) always reset to a safe baseline number when a baby is born, so future generations can keep breeding.

If any, list any changes you have made to your initial proposal due to insufficient time or scope.

I accidentally created a new GitHub repository instead of updating my original one from FA1. Thankfully, because I left detailed commit messages, I could easily track my progress and safely move all my new code and asset structures back into the original repository link required for submission.
 13 October 2026

UPDATED Production timeline and milestone grid:

Phase 1 (FA1):

Milestone ID	Task focus	Dates	Hours	Outcome
Milestone 1	Project planning	August 29 – August 31	4 hours	Explore provided unity scene environment
Milestone 2	Custom breeding system	September 1 – September 3	2 hours	Implement breeding system
Milestone 3	Refining breeding system (add breeding room + love trait)	September 4 – September 6	3 hours	Polish the breeding system into what I truly want.
Milestone 4	Change method of breeding	September 7 – September 8	4 hours	The creatures wait for the love meter to complete before they can breed.
Milestone 5	Mutation polish	September 8 – September 9	2 hours	Implement mutation system.
Milestone 6	Finishing touches	September 10	2 hours	Prepare for submission.

Phase 2 (FA2):

Milestone ID	Task focus	Dates	Hours	Outcome
Milestone 7	Applying lecturer feedback and bug fixes	08 October – 09 October	2 hours	Got valuable feedback about what could be changed and improved.
Milestone 8	Changed the breeding system to rely on combination of parent mesh, making the system more dynamic.	09 October – 11 October	3 hours	Successfully made a unique child based on parents, added a ENUM tracker for monsters, no longer relying on child prefab.
